# Global warming and future climate

SSP5-8.5	Fossil fuel dependent development; no additional climate policy
SSP3-7.0	Development under regional conflict; no additional climate policy
SSP2-4.5	Intermediate development; additional climate policy introduced. Global temperature rises by 2.7°C; emissions in line with aggregate NDC emissions levels by 2030.
SSP1-2.6	Sustainable development; global warming held within 2°C. Zero $CO_2$ emissions in latter half of 21 <sup>st</sup> century.
SSP1-1.9	Sustainable development; global warming held within 1.5°C. Zero $CO_2$ emissions in middle of 21 <sup>st</sup> century.

The Intergovernmental Panel on Climate Change (IPCC) concluded in the 6<sup>th</sup> Assessment Report that "it is unequivocal that human influence has warmed the atmosphere, ocean and land."

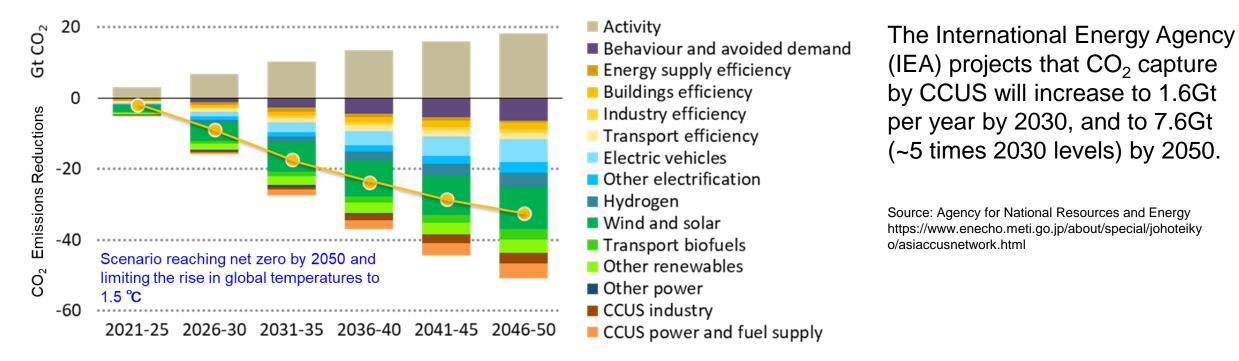

It has been pointed out that in order to limit global warming to  $1.5^{\circ}$ C, CO<sub>2</sub> emissions must be reduced to net zero by the middle of this century.

# What is CCS?

Carbon dioxide Capture and Storage

CCS is a technology to prevent carbon dioxide (CO<sub>2</sub>) released into the atmosphere emitted by facilities such as power plants and factories. The technology involves capturing the CO<sub>2</sub>, injecting it into underground geological formations and storing it permanently. Along with energy efficiency and renewable energy, CCS helps to tackle global warming.

Features of Reservoir

Sandstone, volcanic rock, etc., made of coarse grains

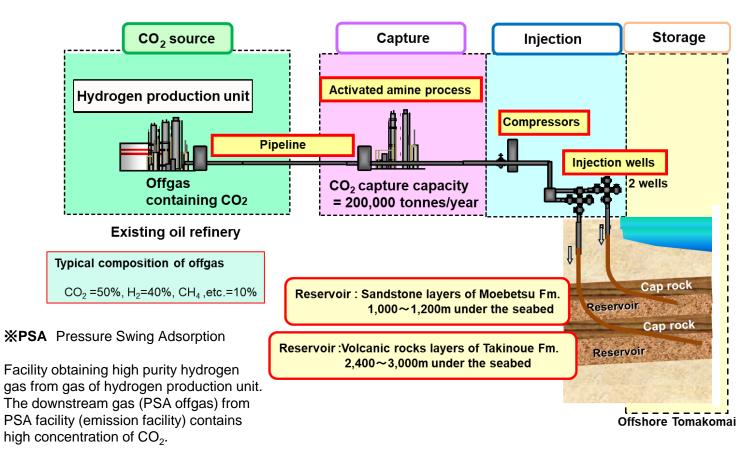

Sufficient pore spaces to store CO2
Pervious

In order to store  $CO_2$  in the subsurface under the seabed, a geological structure where a reservoir is overlain by a cap rock is required. The cap rock blocks the leakage of injected  $CO_2$  from the reservoir.

Cumulative  $CO_2$  Injection amount **300,110.3** 

tonnes

# **Flow Scheme of Tomakomai Demonstration Project**

 $CO_2$  is captured from the offgas containing  $CO_2$  generated by a hydrogen production unit of a refinery, pressurized (up to 23 MPa) to the pressure required for injection, injected at a scale of about 100,000 tonnes of  $CO_2$  per year and stored in two subseabed reservoirs offshore Tomakomai.

### **Schedule of Tomakomai Demonstration Project**

Contract Period: From JFY2012 to JFY2023

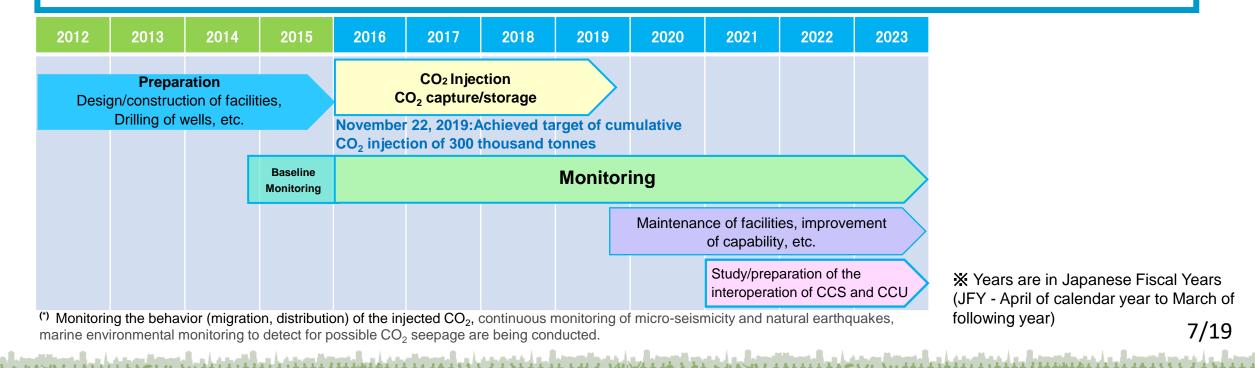

From JFY2012 to JFY2015: Preparation

Activities including the design and construction of facilities, drilling of wells, and preparation for demonstration operation were carried out. From April 2016 to November 2019: CO<sub>2</sub> injection (On November 22, 2019, the target of 300 thousand tonnes of CO<sub>2</sub> injection was achieved, and injection was terminated.)

From JFY2016: Monitoring of  $CO_2^{(*)}$ ; being continued.

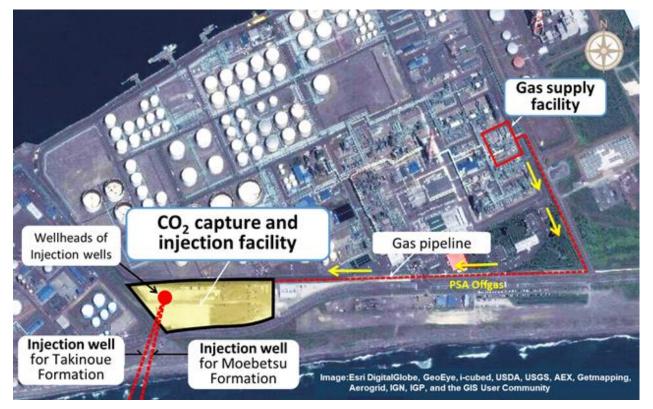

From November 2019: Maintenance of facilities, improvement of capability, etc.

From JFY2021: Study/preparation of the interoperation of CCS and CCU

Cumulative CO<sub>2</sub> Injection amount **300,110.3** 

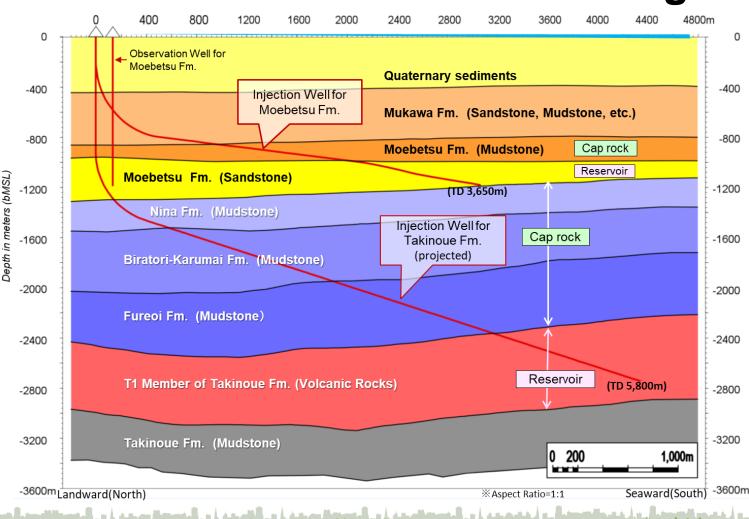

# **Positional Relation of Onshore Facilities**

In the "Gas supply facility", PSA offgas ( $CO_2$  containing gas) is generated in the hydrogen production process of the refinery and sent to the Tomakomai Project "Capture and injection facility" via a 1.4 km gas pipeline.

At the "Capture and injection facility",  $CO_2$  is captured at purity of 99% or more from the PSA offgas sent through the Gas pipeline, pressurized by compressors, and injected by 2 injection wells into offshore sub-seabed reservoirs for storage.

### **Schematic Geological Section**

This is a schematic geological section showing how the  $CO_2$  is injected by two injection wells extending to the two reservoirs, the Takinoue Formation T1 Member (volcanic rocks) and Moebetsu Formation (sandstone).

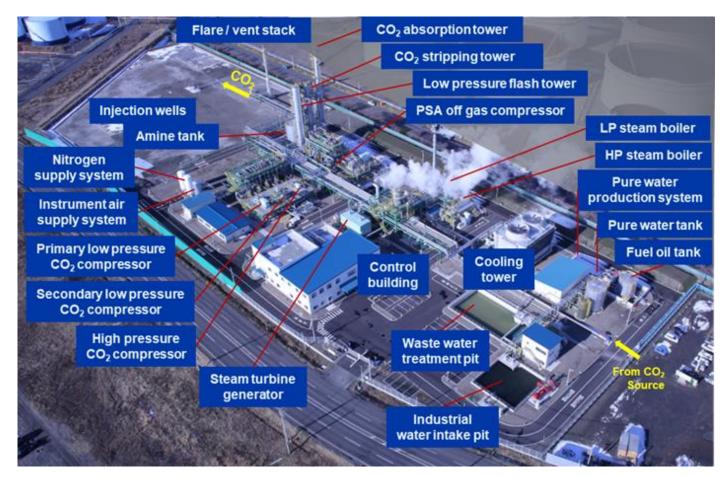

The Takinoue Formation injection well is a directional well with a total depth of 5,800m and maximum inclination of 72 degrees. The Moebetsu Formation injection well is a directional well with a total depth of 3,650m and maximum inclination of 83 degrees.

### Layout of Monitoring Network

المراجع والعوميل والجم والعومال والجهم وفر

الموجوا وجذار والموجوة ومجذا والقوجدا والموجوة ومحد

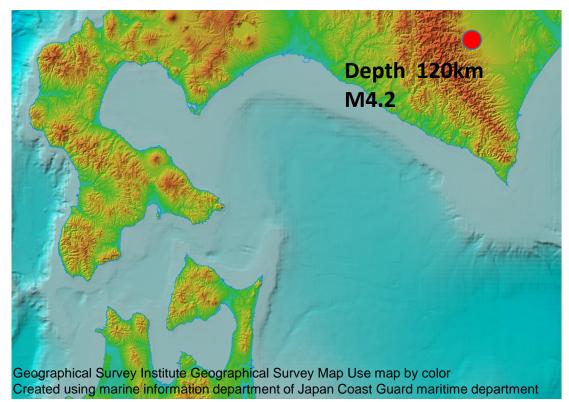

- A monitoring network was constructed near and around the  $CO_2$  injection point, and continuous monitoring over six years comprising before  $CO_2$  injection (1 year), during  $CO_2$  injection (3 years) and after termination of injection is being carried out.
  - The formation pressures and temperatures of the wells - observation wells (3 wells) drilled around the CO<sub>2</sub> injection point and CO<sub>2</sub> injection wells (2 wells) are being monitored.
  - Seismometers were installed in the observation well and on the seabed to monitor earthquakes (including micro-seismicity - minute tremors that cannot be felt by humans).
  - Observed data is controlled centrally at the Tomakomai Demonstration Center and constant monitoring for the presence of abnormal conditions is carried out.

# CO<sub>2</sub> Concentration around injection point(seasonal)

Cruise to the Japan Coast Guard issue navigation chart (W1034)

Seasonal observation of CO<sub>2</sub> concentration is conducted at three onshore points (St.A to C) and 12 offshore points (St.01 to 12). The concentration of CO<sub>2</sub> is indicated as Volume ratio (unit: volppm) at the onshore observation points, and as partial pressure (unit:  $\mu$  atm) at the offshore points. The figures of the offshore points are based on the measurement at 2 meters above the seabed.
