Global warming and future climate

| SSP5-8.5 | Fossil fuel dependent development; no additional climate policy |
|----------|---|
| SSP3-7.0 | Development under regional conflict; no additional climate policy |
| SSP2-4.5 | Intermediate development; additional climate policy introduced. Global temperature rises by 2.7°C; emissions in line with aggregate NDC emissions levels by 2030. |
| SSP1-2.6 | Sustainable development; global warming held within 2°C. Zero CO_2 emissions in latter half of 21 st century. |
| SSP1-1.9 | Sustainable development; global warming held within 1.5°C. Zero CO_2 emissions in middle of 21 st century. |

The Intergovernmental Panel on Climate Change (IPCC) concluded in the 6th Assessment Report that "it is unequivocal that human influence has warmed the atmosphere, ocean and land."

It has been pointed out that in order to limit global warming to 1.5° C, CO₂ emissions must be reduced to net zero by the middle of this century.

What is CCS?

Carbon dioxide Capture and Storage

CCS is a technology to prevent carbon dioxide (CO₂) released into the atmosphere emitted by facilities such as power plants and factories. The technology involves capturing the CO₂, injecting it into underground geological formations and storing it permanently. Along with energy efficiency and renewable energy, CCS helps to tackle global warming.

Features of Reservoir

Sandstone, volcanic rock, etc., made of coarse grains

Sufficient pore spaces to store CO2
Pervious

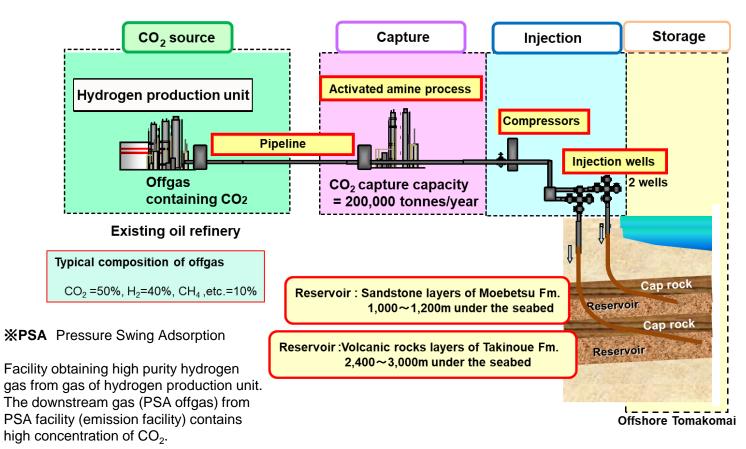

In order to store CO_2 in the subsurface under the seabed, a geological structure where a reservoir is overlain by a cap rock is required. The cap rock blocks the leakage of injected CO_2 from the reservoir.

Flow Scheme of Tomakomai Demonstration Project

 CO_2 is captured from the offgas containing CO_2 generated by a hydrogen production unit of a refinery, pressurized (up to 23 MPa) to the pressure required for injection, injected at a scale of about 100,000 tonnes of CO_2 per year and stored in two subseabed reservoirs offshore Tomakomai.

Schedule of Tomakomai Demonstration Project

Contract Period: From JFY2012 to JFY2023

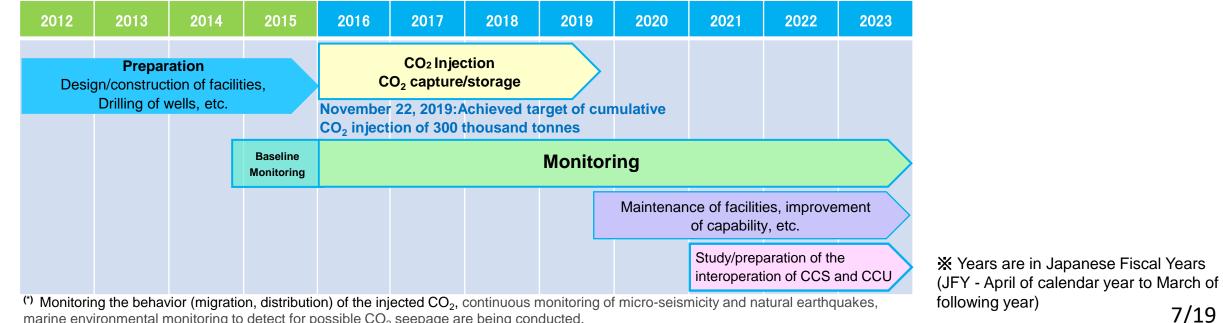

From JFY2012 to JFY2015: Preparation

Activities including the design and construction of facilities, drilling of wells, and preparation for demonstration operation were carried out. From April 2016 to November 2019: CO₂ injection (On November 22, 2019, the target of 300 thousand tonnes of CO₂ injection was achieved, and injection was terminated.)

From JFY2016: Monitoring of $CO_2^{(*)}$; being continued.

From November 2019: Maintenance of facilities, improvement of capability, etc.

From JFY2021: Study/preparation of the interoperation of CCS and CCU

Positional Relation of Onshore Facilities

In the "Gas supply facility", PSA offgas (CO_2 containing gas) is generated in the hydrogen production process of the refinery and sent to the Tomakomai Project "Capture and injection facility" via a 1.4 km gas pipeline.

At the "Capture and injection facility", CO_2 is captured at purity of 99% or more from the PSA offgas sent through the Gas pipeline, pressurized by compressors, and injected by 2 injection wells into offshore sub-seabed reservoirs for storage.

Schematic Geological Section

This is a schematic geological section showing how the CO_2 is injected by two injection wells extending to the two reservoirs, the Takinoue Formation T1 Member (volcanic rocks) and Moebetsu Formation (sandstone).

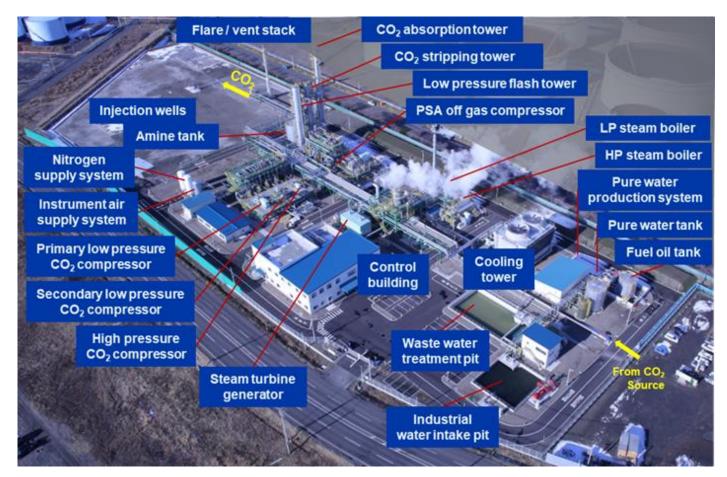

The Takinoue Formation injection well is a directional well with a total depth of 5,800m and maximum inclination of 72 degrees. The Moebetsu Formation injection well is a directional well with a total depth of 3,650m and maximum inclination of 83 degrees.

- A monitoring network was constructed near and around the CO_2 injection point, and continuous monitoring over six years comprising before CO_2 injection (1 year), during CO_2 injection (3 years) and after termination of injection is being carried out.
 - The formation pressures and temperatures of the wells - observation wells (3 wells) drilled around the CO₂ injection point and CO₂ injection wells (2 wells) are being monitored.
 - Seismometers were installed in the observation well and on the seabed to monitor earthquakes (including micro-seismicity - minute tremors that cannot be felt by humans).
 - Observed data is controlled centrally at the Tomakomai Demonstration Center and constant monitoring for the presence of abnormal conditions is carried out.

Micro-seismic events nearby injection point

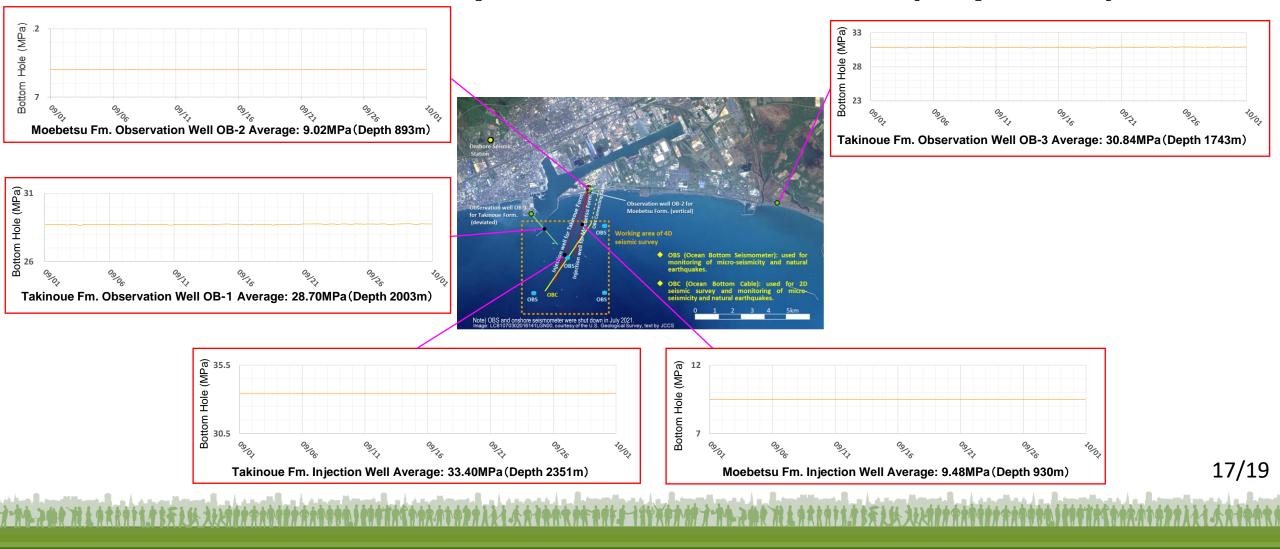

- > There are perceptible earthquakes that can be felt, and imperceptible earthquakes that cannot be felt even though there are actual vibrations.
- > In this project, particularly small (less than magnitude 1) imperceptible earthquakes are defined as micro-seismicity.
- In this project, micro-seismicity with a magnitude of -0.5 or more with a depth of less than 50 km in the vicinity of the injection point are monitored, due to restrictions on the placement of observation points, and constraints on seismograph detection capability, etc.

CO₂ Concentration around injection point(seasonal)

Cruise to the Japan Coast Guard issue navigation chart (W1034)

Seasonal observation of CO_2 concentration is conducted at three onshore points (St.A to C) and 12 offshore points (St.01 to 12). The concentration of CO_2 is indicated as Volume ratio (unit: volppm) at the onshore observation points, and as partial pressure (unit: μ atm) at the offshore points. The figures of the offshore points are based on the measurement at 2 meters above the seabed.
